## Challenges

The basic problem occur during book borrowing Process that may occur due to borrower related To book being ruptured to the book book borrowed And he might don't accept that the book was not Initially like this or at the time of borrowing, Then he might want to cheat on the day of borrowingOf book and return which affects the penalty and fee Charged by the lender, and most of the problem that Generally occurs returning a book that isn't the same And also the basic problem that might take place if The borrower is really a fraud or might want to cheatOn the book and don't want to return the book and But being rigid on that he already returned the book.

## Solution of challenges

So the basic idea of any seller or lender will derive Is that his loss will be less and profit margin compared. To that must be high, so according to it an Database. Is generated to keep the people name, book Id, location,

etc,. And according to it the fee structure is decided and The penalty of the duration is decided. According to this We Will generate an OTP which will be kept to the lender Only which will be confirmed when he/she returns the book Which will be given to the borrower which he will feed in the Database which will count him as the book/s have been submitted by them which will rest there subscription of book. Which will finally Get the work done
